

Base station lead-acid battery voltage range

Overview

The nominal cell voltage of lead acid battery is 2V, stabilizing at about 2.15V when fully charged and at rest. It may sound puzzling to a beginner, but a battery can have a voltage higher than its rated voltage. Because true voltage is a dynamic reading based on its charge level or state. Complete lead acid battery voltage charts for 6V, 12V, 24V, and 48V batteries with temperature compensation and battery type variations. Lead acid battery voltage charts are essential reference tools that show the relationship between battery voltage and state of charge across. Every battery has several important voltage points: Nominal Voltage - The general or "average" voltage the battery provides during discharge. For a 24V system, double these values, and for a 6V battery, halve them.
