

Base station power capacitor

Overview

A capacitor bank in a substation is a critical component designed to improve power quality by: These banks consist of multiple capacitors connected either in series or parallel, functioning as a single unit to store and release electrical energy. Murata offers a lineup that includes conventional 150°C-guaranteed High-Q capacitors and 150°C -guaranteed general decoupling capacitors. This lineup reduces the temperature constraints for using capacitors around the PA and increases design flexibility. These cost-effective devices for harmonic control, energy savings, and voltage stabilization are highly reliable and environmentally safe, and can be used under the most rugged conditions. Lower impedance capacitors ensure. Capacitor banks provide an economical and reliable method to reduce losses, improve system voltage and overall power quality. The demand for higher data rates, lower latency, and increased connectivity in 5G networks drives the need for capacitors with superior performance.
