

# Brief description of solar power generation process

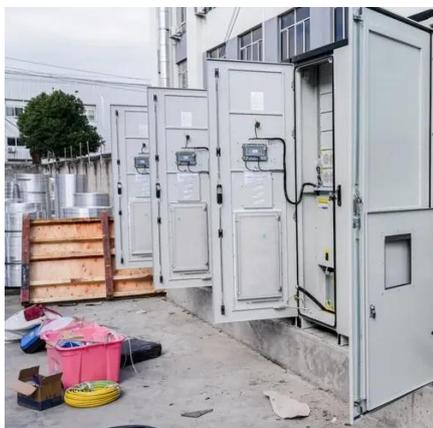

## Overview

---

In a typical solar power generation system, the sunlight strikes the solar panels, generating DC electricity in the photovoltaic (PV) cells. The DC voltage travels through cables to the inverter and the inverter converts the DC electricity into AC electricity. Photovoltaic (PV) technology, solar thermal systems, and concentrated solar power (CSP) are the primary. The amount of sunlight that strikes the earth's surface in an hour and a half is enough to handle the entire world's energy consumption for a full year. The two dissimilar semiconductors possess a natural difference in electric potential (voltage), which causes the electrons to flow through the external circuit, supplying power to the load. The most common type of solar cells used is made from crystalline silicon. This is treated with elements like phosphorous and boron to create something called a p-n junction.
