

Briefly describe the structure of microgrid control scheme

Overview

The organization of a microgrid control system is structured into a hierarchy with three distinct levels: primary, secondary, and tertiary control. This paper provides a comprehensive overview of the microgrid (MG) concept, including its definitions, challenges, advantages, components, structures, communication systems, and control methods, focusing on low-bandwidth (LB), wireless (WL), and wired control approaches. This system integrates diverse power sources, such as solar arrays, wind turbines, and battery storage, collectively known as Distributed Energy Resources (DERs). The Microgrid control functions as the brain of the microgrid, and thus requires a complex design consisting of three levels of control. The Microgrid (MG) concept is an integral part of the DG system and has been proven to possess the promising potential of providing clean, reliable and efficient power by effectively integrating renewable energy sources as well as other distributed energy sources. The energy sources include solar. NLR develops and evaluates microgrid controls at multiple time scales.
