

# Calculation of total capacity of microgrid

## Overview

---

It is calculated by dividing the total solar and wind power generation capacity by the total power demand. The microgrid storage ratio (MGSR) is a measure of the ability of a microgrid to store energy. Resilience, efficiency, sustainability, flexibility, security, and reliability are key drivers for microgrid developments. First, basic concepts of energy potential assessment are introduced, in order to determine if a location is suitable for PV and wind generation systems implementation. excess of energy generation is lost. The study explores heuristic, mathematical, and hybrid methods for microgrid sizing and optimization-based energy management approaches, addressing the need for detailed. This post is part four of our microgrid blog post series and presents a methodology for sizing and modeling a system for resiliency. TerraVerde Energy has developed two tools to assist in microgrid sizing.
