Overview

The lithium battery supply chain typically involves the following key stages: raw material extraction, battery material production, battery cell manufacturing, battery pack assembly, integration into products, distribution and retail, end-of-life management. Energy storage batteries are manufactured devices that accept, store, and discharge electrical energy using chemical reactions within the device and that can be recharged to full capacity multiple times throughout their usable life. Although a wide range of chemistry types for such batteries are. decarbonized, and resilient future transportation and power sectors. [SMM New Energy] As one of the most critical base metals in the new energy industry chain, lithium plays a vital role in power battery and energy storage systems.
