

Giant geothermal system

Overview

Enhanced geothermal systems (EGS) use human-made reservoirs to create the proper conditions for electricity generation by injecting fluid into the hot rocks. This creates new fractures and opens existing ones to enhance the size and connectivity of fluid pathways. There are geothermal power plants all over the world, but a group of ten stand out as seriously powerful producers. Darajat Power Station, Indonesia The tenth largest geothermal plant in the world is located in the Pasirwangi. Conventional geothermal energy is a long-established clean, firm power source, but it has not achieved scale in the United States because it relies on naturally occurring underground structures that exist only in some parts of the country.

Learn about the ten largest geothermal power plants by net capacity. Find out where they are and why they're so amazing.

Geothermal systems are giant radiators

You can think of the geothermal system like an upturned umbrella - it catches a lot of downwelling water across a really wide area and then focuses it into a much narrower upwelling ...

Geothermal Energy

Geothermal energy draws on natural underground heat to make electricity, heat and cool buildings, or provide heat and steam for manufacturing. Like solar and wind power, this energy is ...
