

# Green electricity hungary

## Overview

---

Hungary continues to make significant strides in the development of renewable energy, establishing itself as a leading nation in Central Europe, and according to MAVIR, the country's electricity system operator, the total installed capacity of renewable energy sources has now exceeded. Hungary continues to make significant strides in the development of renewable energy, establishing itself as a leading nation in Central Europe, and according to MAVIR, the country's electricity system operator, the total installed capacity of renewable energy sources has now exceeded. Hungary remains a net electricity importer (historically ~30% of consumption), with domestic generation dominated by nuclear and growing solar. In 2023, nuclear was the largest single source of generation (about mid-40% share). Renewables Share (Recent Trend) Renewables in gross final energy. In line with net zero ambitions, Hungary targets a low-carbon electricity mix of 90% by 2030, with new nuclear and renewables to play a major role. Hungary's National Energy Strategy for 2030 has also been amended to incorporate a vision for 2040 that focuses on clean, smart, and inexpensive energy. The EU has adopted the 2009 Renewable Energy Directive, which included a 20% renewable energy target by 2020 for the EU. [1] By 2030 wind should produce in average 26-35% of the EU's electricity and save Europe €56 billion a year in avoided fuel costs.
