

How much power does a 12V4000w inverter consume

Overview

In the case of 4000 watts power of an inverter, if we take 12 volts as the voltage of the inverter, then the number of amps the inverter will draw will be $4000 \text{ watts} / 12 \text{ volts} = 333.33 \text{ amps}$ with 100% efficiency. Usually, the efficiency of a 100-watt inverter is within 80% to 95%. To maintain such power output, the battery pack must provide sufficient power, and the capacity, quantity and type of the battery will directly affect the performance of the system. 4v (322amp) over the 200amp discharge rate on the battery?

But if you did. Idle current. To calculate the DC current draw from an inverter, use the following formula: $\text{Inverter Current} = \text{Power} \div \text{Voltage}$ Where: If you're working with kilowatts (kW), convert it to watts before calculation: $\text{Inverter Current} = 1000 \div 12 = 83$.
