

New Energy Complementary DC Microgrid

Overview

Integral part of Electricity 4. A DC Microgrid at an Energy User's location can be formed by combining local renewable generation with local electrical energy storage and all the local electrical loads, through a local DC bus. This ratio starkly contrasts historical levels dominated by AC, with native DC loads accounting for. The Transactive Neighborhood Renewable Microgrid Pilot Project aims to create an innovative, multi-customer microgrid demonstration project within the District of Columbia. This pilot project, recommended by the PowerPath DC Pilot Projects Governance Board, seeks to modernize the District's energy. In the new world of electrification, numerous direct current (DC) devices are being added to the grid, including solar panels, variable speed electric motors and electric vehicle (EV) car chargers. As more distributed energy resources (DERs) are integrated into an existing smart grid, DC networks have come. A growing fraction of the combined residential and commercial power load in the US—between 60 and 75 percent—uses DC, driven by the adoption of electric vehicles and HVAC equipment with DC motors.
