

Photovoltaic panel installation angle in winter and summer

Overview

In summer, tilt your panels 15 degrees less than your latitude. This simple adjustment helps maximize sunlight exposure throughout the year. Balanced year-round production; typical fixed setup. This fact causes the winters to be cold due to lower solar radiation and summers to be hot as the solar radiation increases. To make the best out of the available solar radiation, compensating the tilt angle of your panels according to the different positions of the sun will optimize power output. In summer, the sun is higher in the sky, while in winter, it's much lower. Adjusting the angle of solar panels to match seasonal changes can improve efficiency by up to 20-25% annually. In areas with heavy snow or rain, a steeper angle also helps panels shed snow and debris naturally, preventing. Our solar panel angle calculator takes the guesswork out of panel positioning, suggesting panel tilt angles based on your location's latitude and your willingness to reposition based on the sun's seasonal dance across the sky.

Because the sun's path changes throughout the year, you can fine-tune tilt: Summer Tilt: Latitude - 10° to 15° (flatter to catch high sun). Winter Tilt: Latitude + 10° to 15° (steeper to catch low sun). Year ...
