

Planting winter melon under photovoltaic panels

Overview

Potential benefits to the crops will derive from lower plant temperatures, reduced sunburn and improved fruit set. Growing vegetables under solar panels could help feed the world's growing population and meet net-zero targets at the same time. It also serves as a temperature buffer, reducing high summer temperatures by as much as 4°F to 6°F and keeping winter temperatures in crop canopies. Several projects across the country are researching the synergistic benefits of co-locating photovoltaic arrays on vegetable and fruit farms. Additional benefits are expected to be. Agrivoltaics refers to any type of farming or crop cultivation that occurs underneath or around solar panels.
