

Prague high voltage inverter research and development

Overview

An important research focus is the development of voltage-controlled and grid-maintaining inverters for future electricity grids with a large share of renewable sources, as well as tests of micro-grid applications and improvements in control technology. Research is focused on current problems connected with the circuit structures of power electronic converters and algorithms for their control and diagnostics. The mutual interactions of converters with the machines that are fed from them and with the supply networks they are connected to are. In our Multi-Megawatt Lab we can study inverters and their effect on the electricity grid in the multi-megawatt range. In our Digital Grid Lab, we can test both individual solutions and complex systems in realistic surroundings. Tests of insulation systems, overvoltage measurements, partial discharge diagnostics, and research on materials used in the energy. The laboratory collaborates on projects aimed at the diagnosis and development of insulation systems of high-voltage equipment in the field of voltage testing according to standardized procedures or designs testing methods for research purposes. Established in 1953 under the auspices of the Czech Technical University's Research Institute, this laboratory has grown to become a specialist in testing.
