

Small-scale solar power generation system in Luxembourg

Overview

The EU-funded Innova MicroSolar project has delivered a high-performance, cost-effective concentrating solar power (CSP) system for small-scale, onsite electricity and heat generation. Photovoltaic (PV) systems use sunlight to generate electricity directly via semiconductor-based PV. Even a small country can hold great potential for solar energy—limited land area is no longer a barrier to building PV systems. A great example is the construction of two new ground-mounted solar power plants in Luxembourg, developed by the Greenbuddies team. With a total area of 2,586 km². Luxembourg is advancing its sustainable solar initiatives through a new partnership between the Ministry of Energy and Spatial Planning and Preferred by Nature, a non-profit organization with expertise in sustainability advisory services. This collaboration, supported by the Ministry's. Tenders for agrivoltaics and the commercial and industrial (C&I) market, simplified permitting procedures, and financial aid for solar installations are among a series of proposals the government of Luxembourg has adopted to accelerate the rollout of renewable energy technologies. Indeed, Luxembourg must aim to cover 100% of its final energy consumption from renewable sources. These projects will receive a total investment aid of €16.
