

# Smart Distribution Microgrid

## Overview

---

A microgrid can be considered a localised and self-sufficient version of the smart grid, designed to supply power to a defined geographical or electrical area such as an industrial plant, campus, hospital, data centre, or remote community.

Microgrids are small-scale power grids that operate independently to generate electricity for a localized area, such as a university campus, hospital complex, military base or geographical region. The US Department of Energy defines a microgrid as a group of interconnected loads and distributed. NLR has been involved in the modeling, development, testing, and deployment of microgrids since 2001. It can connect and disconnect from the grid to. The IEEE Academy on Smart Grid takes existing material about this key subject of interest and combines it with newly developed materials so the learner is guided through a logical continuous path that better ties the concepts and materials together.
