

# Solar container battery air cooling control

## Overview

---

Air cooling is the most widely used thermal management method in small to medium BESS setups. For every new 5-MWh lithium-iron phosphate (LFP) energy storage container on the market, one thing is certain: a liquid cooling system will be used for temperature control. BESS manufacturers are forgoing bulky, noisy and energy-sucking HVAC systems for more dependable coolant-based options. Among the various methods available, liquid cooling and air cooling stand out as the two most common approaches. Liquid cooling method, usually using a cooler or refrigeration unit, takes away the heat. There are two main approaches: air cooling which uses fans or ambient air convection, and liquid cooling that employs circulation of a coolant through heat exchangers or plates in contact with the cells. The system can be passive, relying on natural convection and strategically placed vents to allow hot air to escape, or active, using fans to force a consistent flow of cool air over the battery modules. The standard unit is prefabricated with modular battery cluster, fire suppression system, HVAC unit and local monitoring.
