

Transmission nodes use European rack-mounted network type

System Topology

Overview

The map shows existing elements and those under construction: power plants, converters, substations and high-voltage cables/lines. PDF maps are available on our Grid Map downloads page. This map is a comprehensive illustration of the transmission system network operated by members of the European Network of Transmission System Operators. This ETS is part 2 of a 4 part ETS, aimed at setting out on a common basis, the installation engineering requirements. Substations serve as critical nodes connecting generation, transmission, and distribution networks. While substations are used for several distinct system functions, most utilize electric power transformers to adjust voltage to match varied voltage requirements along the supply chain. It combines MPLS-TP transport on the backbone with Layer 2 and Layer 3 features on the Ethernet access ports in an integrated industrial housing which can be 19" rack mounted. As the final link in the power distribution chain, rack PDUs ensure efficient delivery of mission-critical power to IT.
