

# What are the photovoltaic microgrids

## Overview

---

A microgrid solar system is a localized energy network that uses solar panels as its primary power source, combined with battery storage and intelligent control systems, capable of operating independently from the main electrical grid when needed. **Microgrid Solar Systems Are More Than Backup Power:** Unlike traditional backup generators, solar microgrids can operate indefinitely during outages and provide continuous economic benefits through reduced electricity bills, demand charge reductions, and potential revenue generation from grid. A microgrid, in short, is a localized energy system that can operate independently or in connection with the main electric grid. This type of system can be used in both off-grid and grid-tied applications.
