

What does microgrid cogeneration mean

Overview

Cogeneration, also known as combined heat and power (CHP), is a highly efficient process that generates both electricity and useful heat from a single fuel source. A type of distributed generation, which, unlike central station generation, is located at or near the point of use. Support solar and wind power resources in microgrids to increase on-site reliability and resiliency. Reduce emissions in sectors that are hard to decarbonize. Together, these technologies offer a powerful way to optimize energy consumption while enhancing operational efficiency. On this page, we introduce you to the technology, explain how it works and show which role it can play in the energy.
