## ENERGY STORAGE SYSTEM

**Product Model**  
HJ-ESS-215A(100KW/215KWh)  
HJ-ESS-115A(50KW 115KWh)

**Dimensions**  
1600\*1280\*2200mm  
1600\*1200\*2000mm

**Rated Battery Capacity**  
215KWH/115KWH

**Battery Cooling Method**  
Air Cooled/Liquid Cooled

How can you effectively use a 16-bit fixed point DSP controller to reduce the size of a dc-ac inverter, increase efficiency, and improve the total harmonic distortion (THD) — especially in the presence of highly nonlinear loads?

. How can you effectively use a 16-bit fixed point DSP controller to reduce the size of a dc-ac inverter, increase efficiency, and improve the total harmonic distortion (THD) — especially in the presence of highly nonlinear loads?

. A cost-effective solution to inverter design is based on advances in digital signal processor (DSP). Powerful 16-bit, fixed point DSPs incorporate all the necessary circuitry required by power electronics applications such as: PWM channels, A/D converters, CAN interface, internal and/or external. An inverter converts direct current (DC) into alternating current (AC) by mechanical or electronic means and makes renewable resources and energy-storage systems utility interactive. Inverters are basic components on most small and large energy systems that convert low-voltage DC power generated. Digital Signal Processing (DSP) has revolutionized the field of power electronics by enabling the development of more efficient, reliable, and flexible power systems. In this article, we will explore the key concepts, applications, and best practices of DSP in power electronics. Done some research and consideration, toss up between Texas Instruments C2000 and Infineon XMC4000. Would like to hear other people's own experiences and thoughts. I am starting from scratch an have some knowledge. Technology improvements, such as low-voltage chips, help reduce energy consumption for a given set of system features and level of performance. But system features and performance are moving targets: typically, with each product generation designers must integrate additional energy-consuming.
