

Whether the high voltage end of the inverter shares a common ground

Overview

In the proposed inverter structure, there is a common ground for the input and output terminals. There is no correct answer to this question. How a system is grounded, whether the AC is floating (not grounded), the DC negative is floating, the equipment chassis is floating, or any or all of them share a common ground (or none at all) will vary depending on the rules, regulations and norms of. An SMA product (PV, hybrid, battery or Sunny Island inverter) is part of a PV system in which each component, if connected incorrectly, can affect the system in an undesirable way., the decision depends on the type of. The NEC requires DC circuits that can have voltages above 50v to have one of the legs of the circuit grounded to the same ground circuit as the AC. How would grounding the DC negative and having a common neutral create any new risk when the inverters effectively create the same common neutral as.
